Variables & Operators. Variables allow you to store values for later use. For example, you can store the value "Kevin" in the variable myName. Operators are symbols that allow you to perform arithmetic (e.g. adding two numbers), comparisons (e.g.

Before we can figure out the 100th term, we need to find a rule for this arithmetic sequence. Remember, the general rule for this sequence is $a_n = a_1 + (n-1)d$, where a_1 represents the first number in the sequence, d is the common difference between consecutive numbers, and n is the n -th number in the sequence. In our problem, $a_1 = 1$. Also, each time we move up from one ...

If the only ways of proving the consistency of arithmetic make essential use of notions which arguably belong to higher-order mathematics, then the consistency of arithmetic, even though it can be expressed in the language of Peano Arithmetic, is a non-arithmetical problem.

Geometry is, with arithmetic, one of the oldest branches of mathematics. It started with empirical recipes concerning shapes, such as lines, angles and circles, which were developed mainly for the need of surveying and architecture.. A fundamental innovation was the elaboration of proofs by ancient Greeks: it is not sufficient to verify by measurement that, say, two lengths are equal.
